

**IN THE CLAIMS:**

1. (Currently Amended)            A safety razor apparatus having a blade assembly comprising two guiding members each having a surface for abutting against the skin, and one or more blades located between said two guiding members wherein ~~the a~~ cutting edge of each blade and said surfaces are positioned substantially in one plane, and the apparatus has a grip portion being pivotal relative to said blade assembly about a pivot axis wherein the pivot axis is positioned parallel to said cutting edge of each blade, characterized in that a location of said pivot axis is adjustable with respect to said blade assembly the pivot axis being adjustable to different locations on the blade assembly.
  
2. (Currently Amended)            A safety razor apparatus as claimed in claim 1, characterized in that the pivot axis can be fixed in two or more ~~positions with respect to~~ locations on the blade assembly.
  
3. (Previously Presented)           A safety razor apparatus as claimed in claim 1, characterized in that said pivot axis can be fixed at different locations in a plane parallel to said one plane.
  
4. (Currently Amended)            A safety razor apparatus as claimed in claim 1, characterized in that the blade assembly can hinge around a pin, the pin forming the pivotal axis, which pin is attached to said grip portion wherein the blade assembly is provided with means for engaging said pin.
  
5. (Previously Presented)           A safety razor apparatus as claimed in claim 4, characterized in that said means for engaging said pin comprise a number of recesses at different locations for accommodating said pin at such different locations.
  
6. (Previously Presented)           A safety razor apparatus as claimed in claim 4, characterized in that said means for engaging said pin comprise clamping means for holding said pin in a recess.

7. (Previously Presented) A safety razor apparatus as claimed in claim 6, characterized in that said clamping means enable displacement of the pin from a recess to another recess when a predetermined force is being exerted.

8. (Previously Presented) A safety razor apparatus as claimed in claim 4, characterized in that said pin is positioned between a first engaging member provided with a number of recesses and a second engaging member having a surface facing said first engaging member, wherein said second engaging member pushes said pin towards said first engaging member.

9. (Cancelled)
